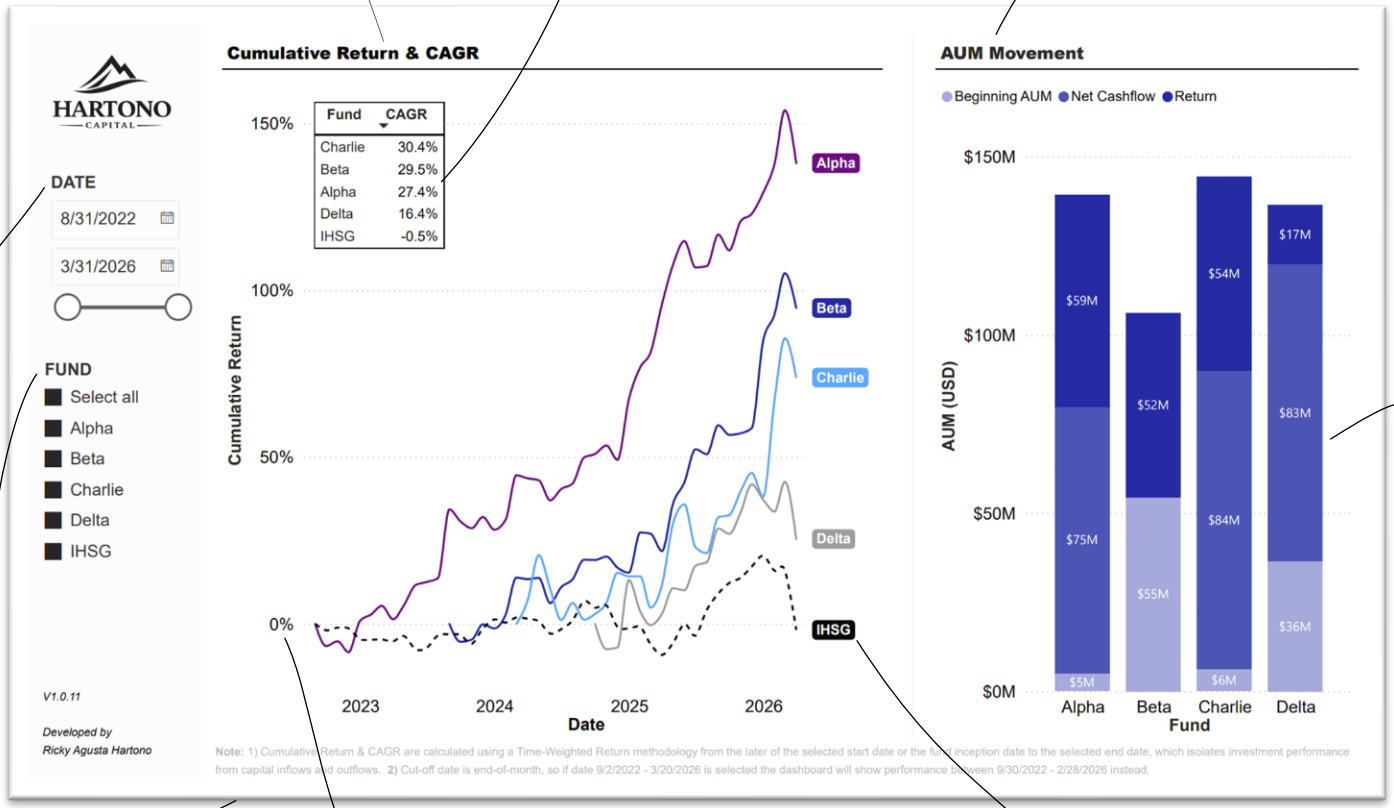
Hartono Capital Live Power BI Investment Dashboard is designed to (1) objectively evaluate fund performance using the Time-Weighted Return (TWR) methodology and (2) quantify the monetary returns generated by each fund.

Process
Cumulative return & CAGR are calculated using the Time-Weighted Return (TWR) method, based on month-end NAV changes between periods within the selected date range.

Output
CAGR table to show selected fund performance from the later of the fund inception date or the selected start date to the selected end date.

Process
AUM movement breaks down changes in AUM into three components: beginning AUM at the selected date, net cash flows during the period (capital inflow – capital outflow), and fund returns at the end of the period.



Input
A date slicer to filter chart calculations.

Input
A multi-select fund selector to control which funds are displayed in the chart area.

Output
A stacked column chart shows individual fund movement, indicating whether changes are driven by returns, net cash flows, or even losses.

Tool:
Integrated Live Power BI dashboard

Output
All fund performance series are normalized to start at 0%, ensuring a consistent and comparable view of cumulative returns over the selected period.

Output
IHSG is used as a benchmark to assess whether the funds outperform the index.
